

Forklift Fork Positioner

Fork Positioner for Forklifts - A fork positioner is actually an apparatus made out of top quality materials designed to be able to endure the most difficult procedures and work environments. This particular piece of equipment enables the person driving to control the forks hydraulically without leaving the seat. Side shifting units have the extra ability to laterally position the arms or the entire load so as to facilitate much more precise lifting and position in a faster and more effective way.

The unique fork pocket design enables the one operating it to securely swing the unit's forks without any worry of destroying the positioning cylinders. This allows the operator the option to either execute independent or simultaneous fork movement, depending on the job requirement. For most forklifts with non-OEM carriages, complete carriages are needed. Standard OEM carriages could be converted into blade positioners on available units.
